Abstract

The purposes of this project were to developed a system for managing home construction project of Plan consultant company and to checked the defects via mobile. This system will reduce data mistake problem and help to collect data to track the project, House and condo construction. This system was both in to form of website and mobile application.

It was developed together with the MySQL database that using database simulation program, XAMPP to test and adjust the system.

PHP,CSS,HTML and JavaScript were use together with Visual studio Code, androidstudio for developing and formatting the layout of user interphase in each parts of the system. The database was managed through PhpMyAdmin program.The system user was divided into 3 types, system administrators, supervisors and staffs.

The result found that this system can actually be used covering in various fields according

to the defined scope.
